Data Analytics Case Study: Swiggy Sales Performance

1. Project Overview

As a data professional, I believe that data is only as valuable as the decisions it enables. I built this end-to-end business intelligence tool to transform raw transactional logs from a major food delivery platform into a dynamic, interactive dashboard that allows stakeholders to identify revenue bottlenecks, track operational health, and uncover market opportunities.

2. Dashboard Design & Functionality

My goal was to create a clean visual hierarchy that allows an executive to scan the primary health metrics in seconds. I utilized Excel's advanced data modeling, pivot tables, and dynamic slicers to ensure the dashboard remains fully responsive.

- **The KPI Layer:** I aggregated primary health metrics, highlighting ₹53M+ in total revenue, 197K+ orders, and a 4.34/5 user rating.
- **The Analytical Layer:** I built specific visualizations to address operational problems, including temporal demand cycles, regional performance, and culinary category splits.
- **Interactive Controls:** I integrated synchronized cross-filtering slicers (State, Month, Category, Food Type) to provide users with full control over the analysis.

3. Insights & Business Solutions

Identifying the "Tuesday Slump": By analyzing daily sales trends, I noticed a consistent operational valley every Tuesday (₹7.35M) compared to Saturday peaks (₹7.78M). My solution is to incentivize mid-week demand through corporate B2B lunch bundles and loyalty multipliers, effectively flattening the demand curve and improving fleet efficiency.

Addressing Geographic Dependency: I found that Bengaluru drives nearly double the revenue of other tier-1 markets, creating a dangerous dependency. I recommend replicating the specific merchant onboarding and marketing playbook used in Bengaluru to systematically scale operations in Mumbai and New Delhi.

Untapped Vegetarian Market: Non-vegetarian items dominate with 64% of sales, leaving vegetarian options at just 36%. Given India's affluent vegetarian demographic, I proposed the launch of a "Swiggy Green" platform filter to attract premium family basket sizes.

4. Technical Challenges & Overcoming Them

Mapping Engine Limitations: Excel's native map engine struggled to identify sub-regional Indian boundaries. I solved this by engineering a custom geographic hierarchy, positioning the *Country* column strictly left of the *State* column to guide the mapping logic.

UX Optimization: I noticed charts defaulted to a non-intuitive order. I manually toggled "Categories in reverse order" across the axis properties to ensure top-performing assets were prioritized at the top for faster, natural executive readability.

This project was not just about building a chart; it was about navigating messy data, fixing broken engineering pipelines, and extracting a strategic narrative that can actually influence business growth.
